

Measure implemented so that Invoice cannot be Edited or Deleted

Immutable Records:

- When a bill is created, it has been treated as an immutable record. Once stored in the system, its data fields has been set as read-only or constant.
- In a database, we have use constraints to make certain fields immutable.

Database Constraints:

- We have utilize database constraints to prevent updates or deletions. For example, setting up the database to disallow UPDATE and DELETE operations on the rows corresponding to bills.

Audit Trails:

- Implemented an audit trail to track changes made to records. Even though users cannot directly edit or delete bills, the system has log any attempts or changes made for accountability.
- Stored a history of changes, including timestamps and the user who made the change.

User Permissions:

- Implemented strict user permission controls, no users should have the privilege to edit or delete bills.
